

Apraxia Walk

MORT 11 attended the Apraxia Walk on Saturday, August 13th in Duke Island Park. Our team joined the childhood apraxia of speech association. Childhood apraxia of speech (CAS) is considered a neurological speech disorder that affects a child's ability to clearly correctly produce syllables and words. The most obvious thing that others notice is that the child has significantly limited and/or unclear speech. Students, mentor, and family participation helped our team reach out to those in need of programs such as speech therapist workshops, research, and ways to aid families in paying for speech therapy. During the event students took the robot on a stroll with them as they walked for a cause. As many walkers were fascinated about the robot, student did not hesitate to talk about FIRST's robotics program.
